

Modbus If

User Guide

The Modbus If group app will execute all apps within the group if the configured modbus signals are detected when the app is executed. If the signals are not detected at the moment when the app is executed, the group will be skipped.

Tab: Modbus Configuration

Here you can configure the modbus configuration that will be queried against the detected modbus signal.

Option: What kind of signal type do you want to check for?

Select whether you want to check for an Input or Output modbus signal.

Option: Modbus Configuration

Configure the modbus signal, including Module(s), Cards(s) and Pin(s). Click on the pins to indicate whether the signals should be on (green) or off (red).

Option: Execute the group if

Select whether the group will be executed if all of the configured signals are detected, or at least one of the configured signals is detected.
